

Name:

**Instructions:**

- All answers must be written clearly.
- You may use a calculator, but you must show all your work in order to receive credit.
- Be sure to erase or cross out any work that you do not want graded.
- If you need extra space, you may use the back sides of the exam pages (if you do, please write me a note so that I know where to look).
- You must include all work to receive full credit.

3. A manufacturing company sources widgets from three different suppliers (A, B, and C). Based on the company's quality control data, it appears that 3 percent of widgets coming from A are faulty, as are 5 percent of the widgets coming from B, and 2 percent coming from C. Based on recent purchasing records, suppliers A, B, and C supply 30 percent, 20 percent, and 50 percent of the company's stock of widgets, respectively.

(a) What is the probability that a random widget from the company's stock is faulty?

(b) Given that a widget is faulty, what is the probability that it came from supplier C?

(c) Using the definition of independence of events, determine whether the events  $F = \{\text{widget is faulty}\}$  and  $C = \{\text{widget came from supplier C}\}$  are independent or not.

4. UNH students have designed the new u-phone. They have determined that the lifetime of a U-Phone is given by the random variable  $X$  (measured in hours), with probability density function

$$f(x) = \begin{cases} \frac{10}{x^2} & x \geq 10 \\ 0 & x \leq 10 \end{cases}.$$

- (a) Use the PDF to find the probability that the u-phone will last more than 20 hours?

- (b) Use the PDF to find the probability that the u-phone will last less than 50 hours.

- (c) What is the mean life of the u-phone?

5. You should also know how to answer questions regarding the following distributions. See study guide, past exams, and past sample exams.
- (a) Binomial
  - (b) Poisson
  - (c) Exponential
  - (d) Normal

6. Suppose the joint density function of the random variables  $X$  and  $Y$  is

$$f(x, y) = \begin{cases} c(x + y) & 0 < x < 1, 0 < y < 1 \\ 0 & \text{otherwise} \end{cases}.$$

(a) Find the value of  $c$ .

(b) Set up the double integral for  $\mathbb{P}(X^2 + Y^2 \leq 1)$ . No need to evaluate.

(c) Compute  $\mathbb{P}(Y > 3X)$

### Useful definitions and facts:

Law of Total Probability. If  $F_1, \dots, F_n$  are mutually exclusive events such that they make up the whole sample space,  $S = \bigcup_{i=1}^n F_i$  then

$$\mathbb{P}(E) = \sum_{i=1}^n \mathbb{P}(E | F_i) \mathbb{P}(F_i).$$

Bayes's Formula. If  $F_1, \dots, F_n$  are mutually exclusive events such that they make up the whole sample space,  $S = \bigcup_{i=1}^n F_i$  then we have the following conditional probabilities:

$$\mathbb{P}(F_j | E) = \frac{\mathbb{P}(E | F_j) \mathbb{P}(F_j)}{\sum_{i=1}^n \mathbb{P}(E | F_i) \mathbb{P}(F_i)}.$$

for each  $j = 1, \dots, n$ .

#### • Discrete random variable:

– **PMF (Probability Mass Function):**  $p_X(x) := \mathbb{P}(X = x)$ , (NOTE: some texts may use the notation for  $f_X(x) = \mathbb{P}(X = x)$  to denote the PMF)

\* Properties of a pmf  $p(x)$ :

\* Note that we must have  $0 < p(x_i) \leq 1$  for  $i = 1, 2, \dots$  and  $p(x) = 0$  for all other values of  $x$  can't attain.

\* Also must have

$$\sum_{i=1}^{\infty} p(x_i) = 1.$$

– **CDF:**  $F_X(x) := \mathbb{P}(X \leq x)$ .

#### • Continuous Random Variables:

• A random variable  $X$  is said to have a **continuous distribution** if there exists a nonnegative function  $f_X$  (called the probability distribution function or **PDF**) such that

$$\mathbb{P}(a \leq X \leq b) = \int_a^b f_X(x) dx$$

for every  $a$  and  $b$ .

– All **PDFs** must satisfy:

1.  $f(x) \geq 0$  for all  $x$

2.  $\int_{-\infty}^{\infty} f(x) dx = 1$ .

– **CDF:**  $F_X(x) := \mathbb{P}(X \leq x)$

• **Expected Values:** If  $g : \mathbb{R} \rightarrow \mathbb{R}$

– Discrete R.V.: List  $X \in \{x_1, x_2, \dots\}$

\*  $\mathbb{E}[g(X)] = \sum_{i=1}^{\infty} g(x_i) p_X(x_i)$

– Continuous R.V.:

$$* \mathbb{E}[g(X)] = \int_{-\infty}^{\infty} g(x) f_X(x) dx$$

- **Fact:** For continuous R.V we have the following useful relationship

- Since  $F_X(x) = \mathbb{P}(X \leq x) = \int_{-\infty}^x f_X(y) dy$  then by the fundamental theorem of calculus we have

$$F'_X(x) = f_X(x).$$

- How to find the PDF of  $Y = g(X)$  where  $X$  is the PDF of  $X$ .

- **Step1:** First start by writing the cdf of  $Y$  and in terms of  $F_X$ :

- **Step2:** Then use the relation  $f_Y(y) = F'_Y(y)$  and take a derivative of the expression obtained in Step 1.

- **Joint Distributions:**

- **Discrete: joint probability mass(discrete density) function**

$$p(x, y) = \mathbb{P}(X = x, Y = y).$$

\* Some texts may use  $f(x, y)$  to denote the PMF.

- **Continuous:** For random variables  $X, Y$  we let  $f(x, y)$  be the **joint probability density function**, if

$$\mathbb{P}(a \leq X \leq b, c \leq Y \leq d) = \int_a^b \int_c^d f(x, y) dy dx.$$

\* Or in general if  $D \subset \mathbb{R}^2$  is a region in the plane then

$$\mathbb{P}((X, Y) \in D) = \int \int_D f(x, y) dy dx.$$

- **INDEPENDENCE:**

- Continuous (discrete) r.v.  $X, Y$  are independent if and only if their joint pdf (pmf) can be expressed as

$$f_{X,Y}(x, y) = f_X(x)f_Y(y). \text{ (Continuous Case),}$$

$$p_{X,Y}(x, y) = p_X(x)p_Y(y) \text{ (Discrete Case).}$$
